

Semianthropomorphic Liver Phantom

QRM-Liver-Phantom

This phantom can be used in CT and FD-CT for the examination of low contrast details in the liver region. The phantom is also a good choice to analyze computer aided diagnoses (CAD) procedures.

The QRM-Liver-Phantom is designed in a modular construction principle. The phantom is made up of three changeable parts: the anthropomorphic abdomen phantom body, the liver insert and the spleen insert.

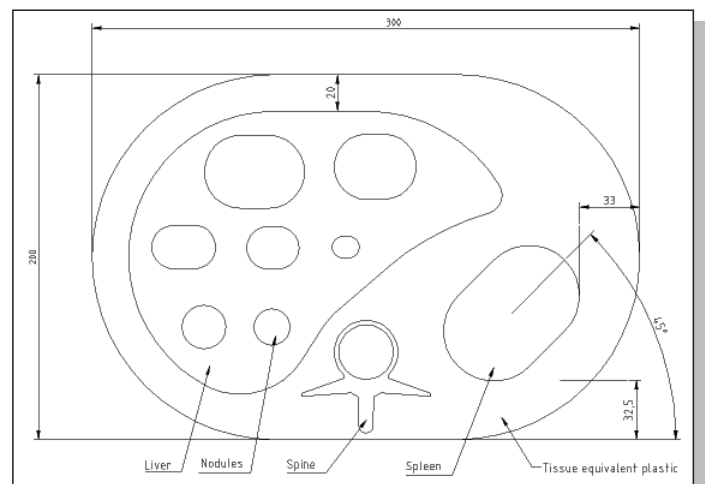

The **abdomen body** comprises spine with vertebral bone and a shell of soft tissue equivalent material. The plastics used in this anthropomorphic phantom mimic human tissues in the thorax with respect to density and attenuation characteristics (tissue-equivalent solid of typically 35 HU +/- 5 HU at 120 kV).

The **liver insert** contains multiple spherical liver tumors/nodules of different size, shape and in two different densities. The shape of these tumors can be adapted in size and density upon your request.

The **spleen insert** is solid homogeneous material. tumors or other structures are available upon request.

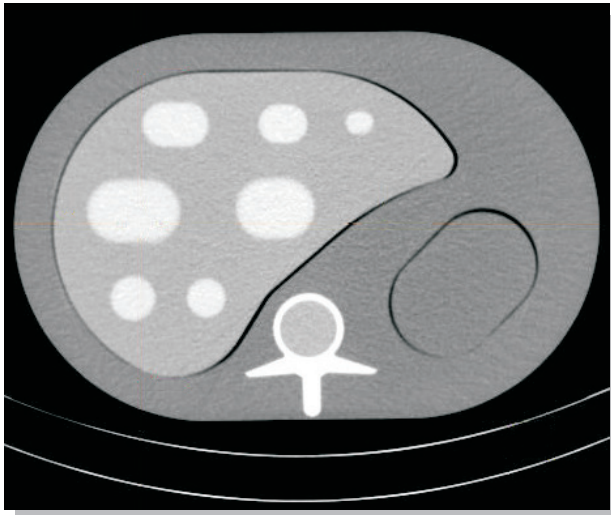

QRM-Liver-Phantom with exchangeable liver insert

CT-slices of the Liver Phantom with hypodense liver nodules at a standard abdomen protocol.

Specifications

Phantom size..... 300 x 200 x 100 mm
 Phantom weight (total)..... 4200 g
 Base material resin

Approximately CT values at 120 kV

Abdomen Body..... 35 HU
 Liver Insert..... 90 HU
 Liver Nodule Typ 1 45 HU
 Liver Nodule Typ 2..... 180 HU
 Spleen Insert..... 35 HU

Extension Rings (fat rings) are also available in different sizes to simulate obese patients.
